

Well mitigation strategy

- Assess and improve well information
- Assess drinking water well vulnerabilities
- Identify mitigation strategies
 - interim and long-term
- Develop outreach and communication
- Define the role of the County
- Prioritize actions and procure funds
- Collaborate and receive support from State agencies and others

- Reference: *Framework for a Drinking Water Well Impact Mitigation Program*, by Self-Help Enterprises, Leadership Counsel for Justice and Accountability, and the Community Water Center
- Examples of existing Drinking Water Well Impact Mitigation Programs: [Well-Mitigation-Case-Studies.pdf](https://www.selfhelpenterprises.org/Well-Mitigation-Case-Studies.pdf) ([selfhelpenterprises.org](https://www.selfhelpenterprises.org))

Assess drinking water well vulnerabilities

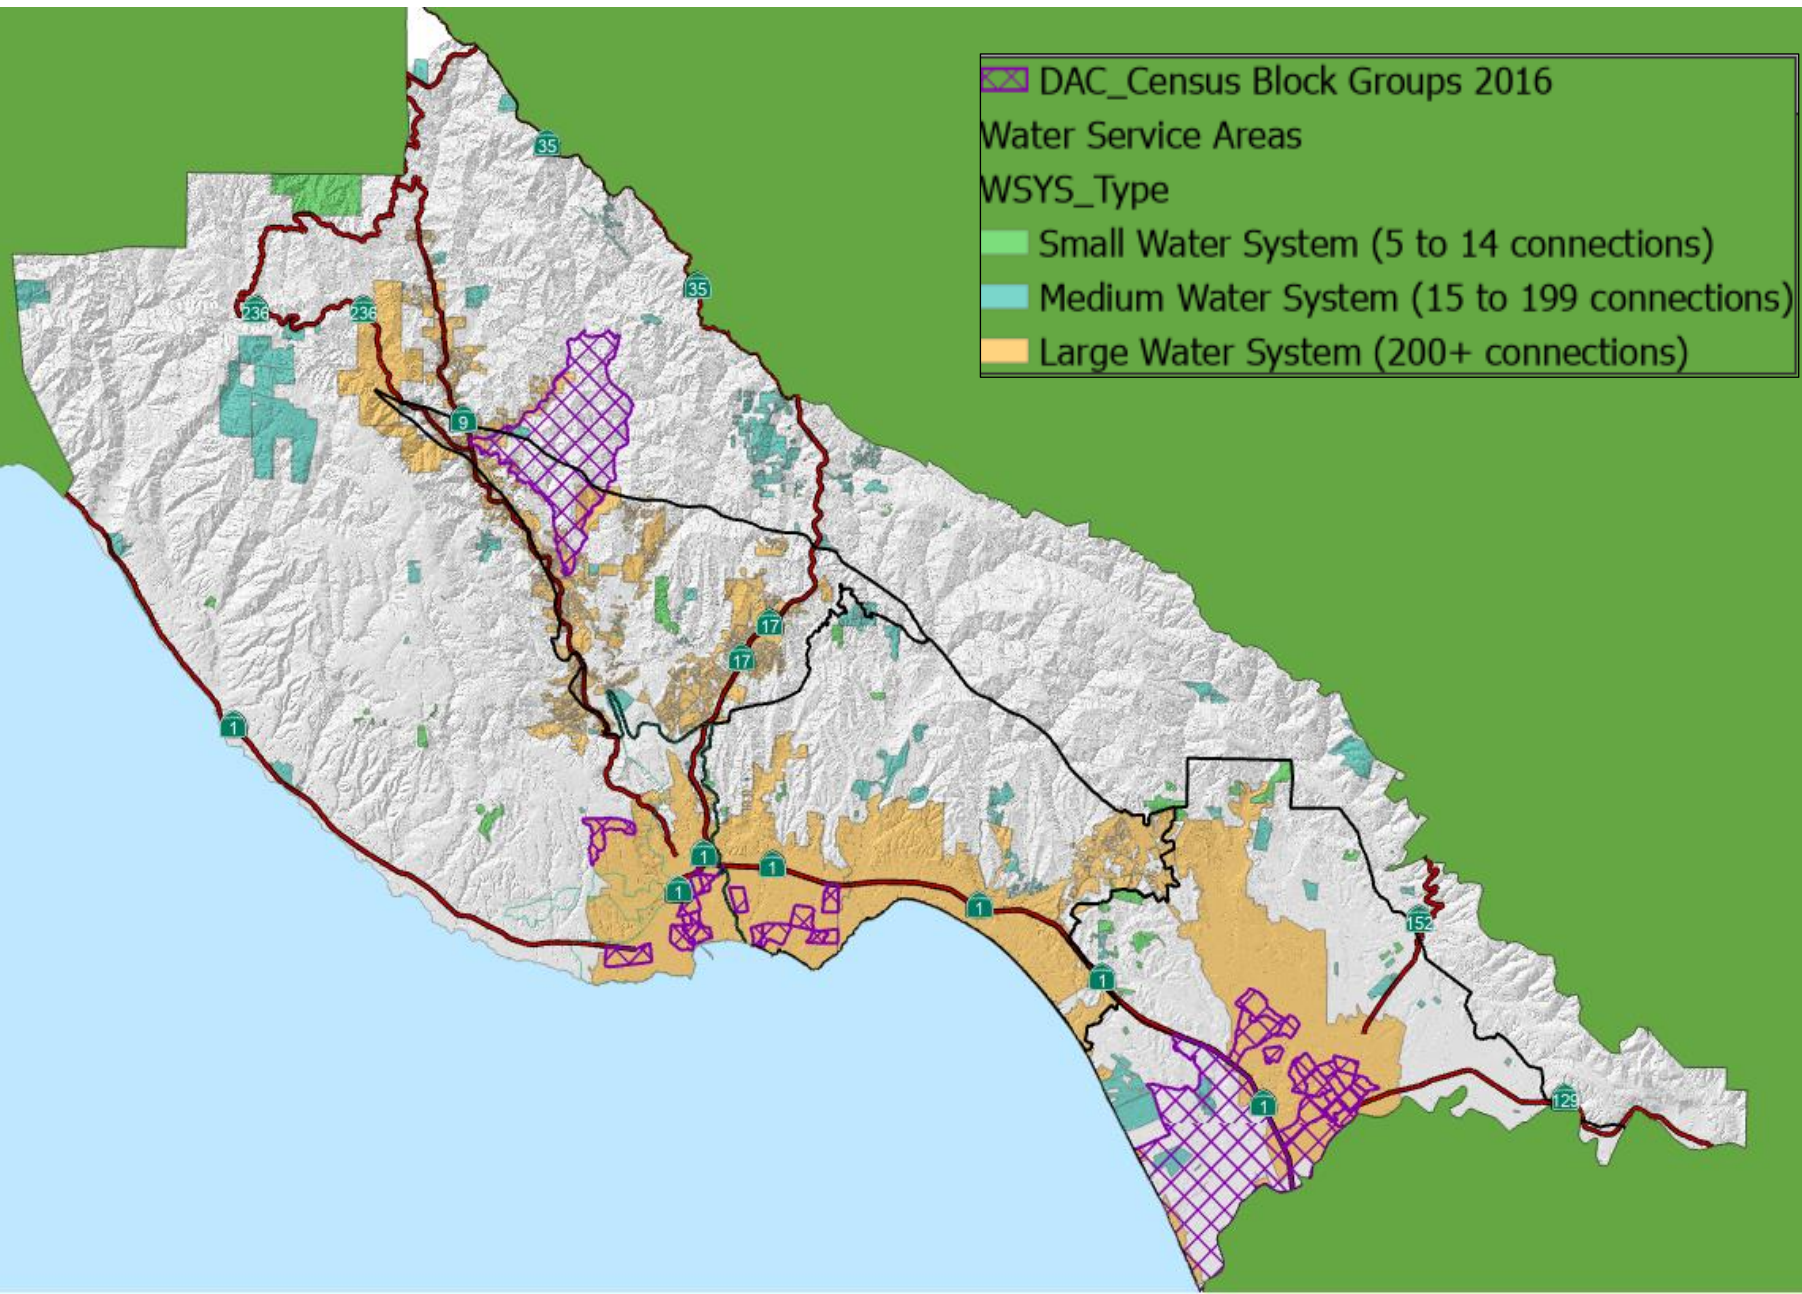

- Vulnerability assessment
 - Disadvantaged communities (DACs)
 - Annual median household income (MHI) is less than 80 percent of the Statewide annual MHI. "Severely Disadvantaged Communities" have an annual MHI that is less than 60 percent of the Statewide annual MHI
 - Water supply vulnerability
 - Water quality vulnerability
 - Others (e.g., location; depth; proximity to pumping/management activity; high density of wells)
 - How do we define vulnerability in Santa Cruz County?

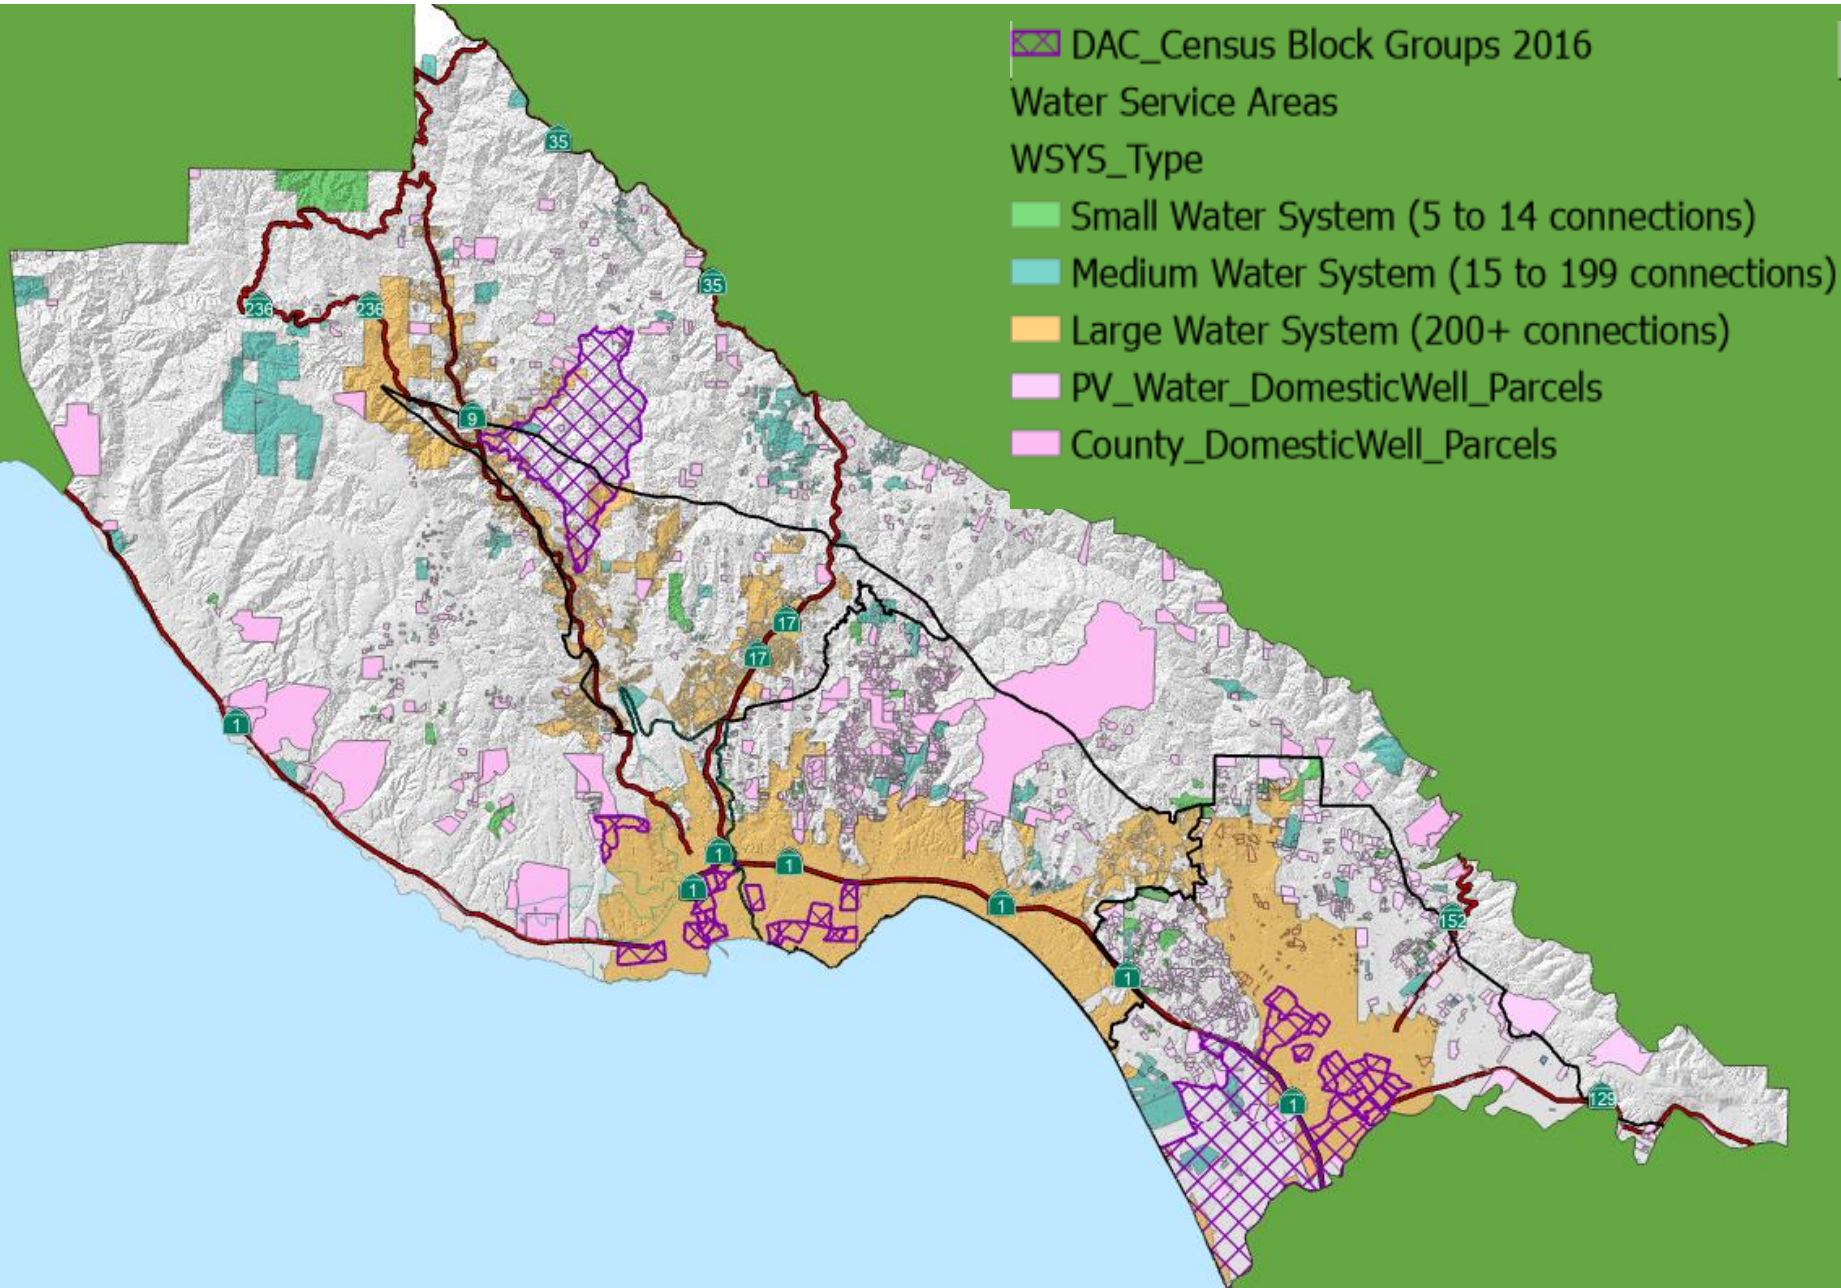

Assess drinking water well vulnerabilities

- State-supported vulnerability assessment tools
 - [DWR Drought Risk Explorer - Rural Communities \(March 2021\)](#)
 - State Water Board [2022 Aquifer Risk Map \(ca.gov\)](#)
 - [California's Groundwater Live: Well Infrastructure \(arcgis.com\)](#)
 - [State Water Board GAMA - OnLine Tools](#)
- Building County data collection and mapping resources

Disadvantaged Communities and Water Systems

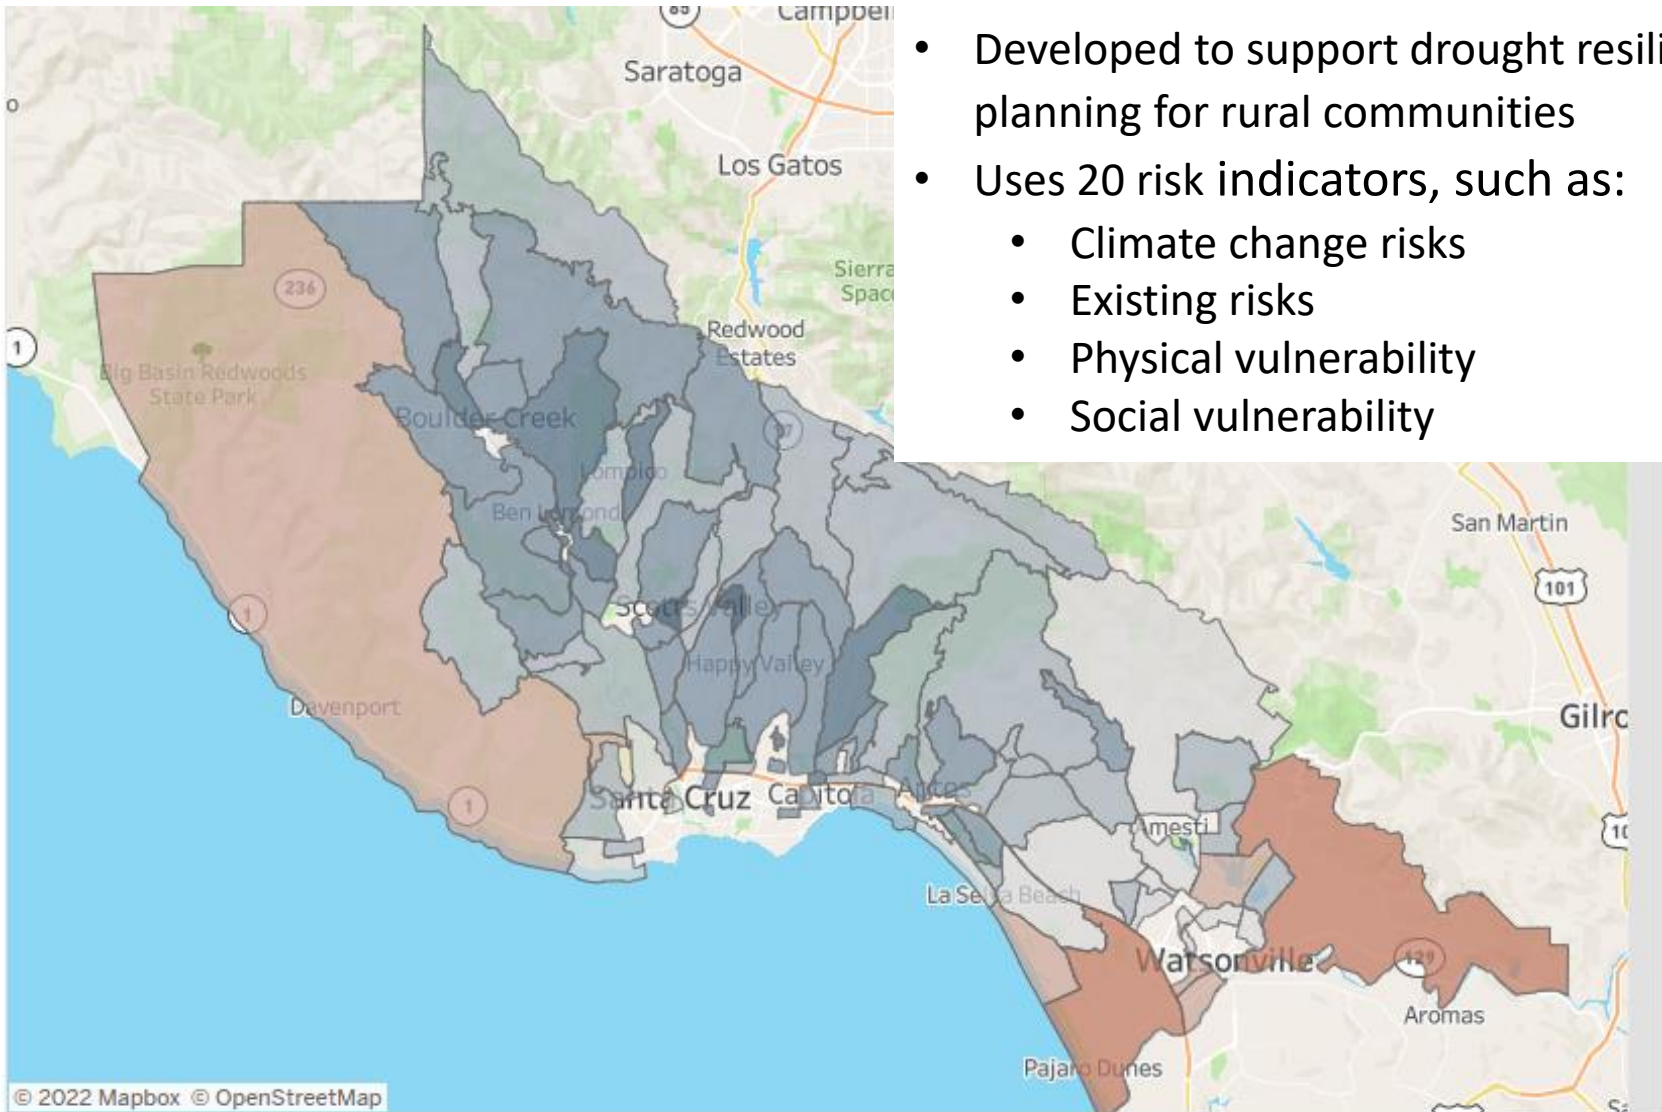

Disadvantaged Communities, Water Systems & Parcels with Domestic Wells

DWR Drought Risk Explorer

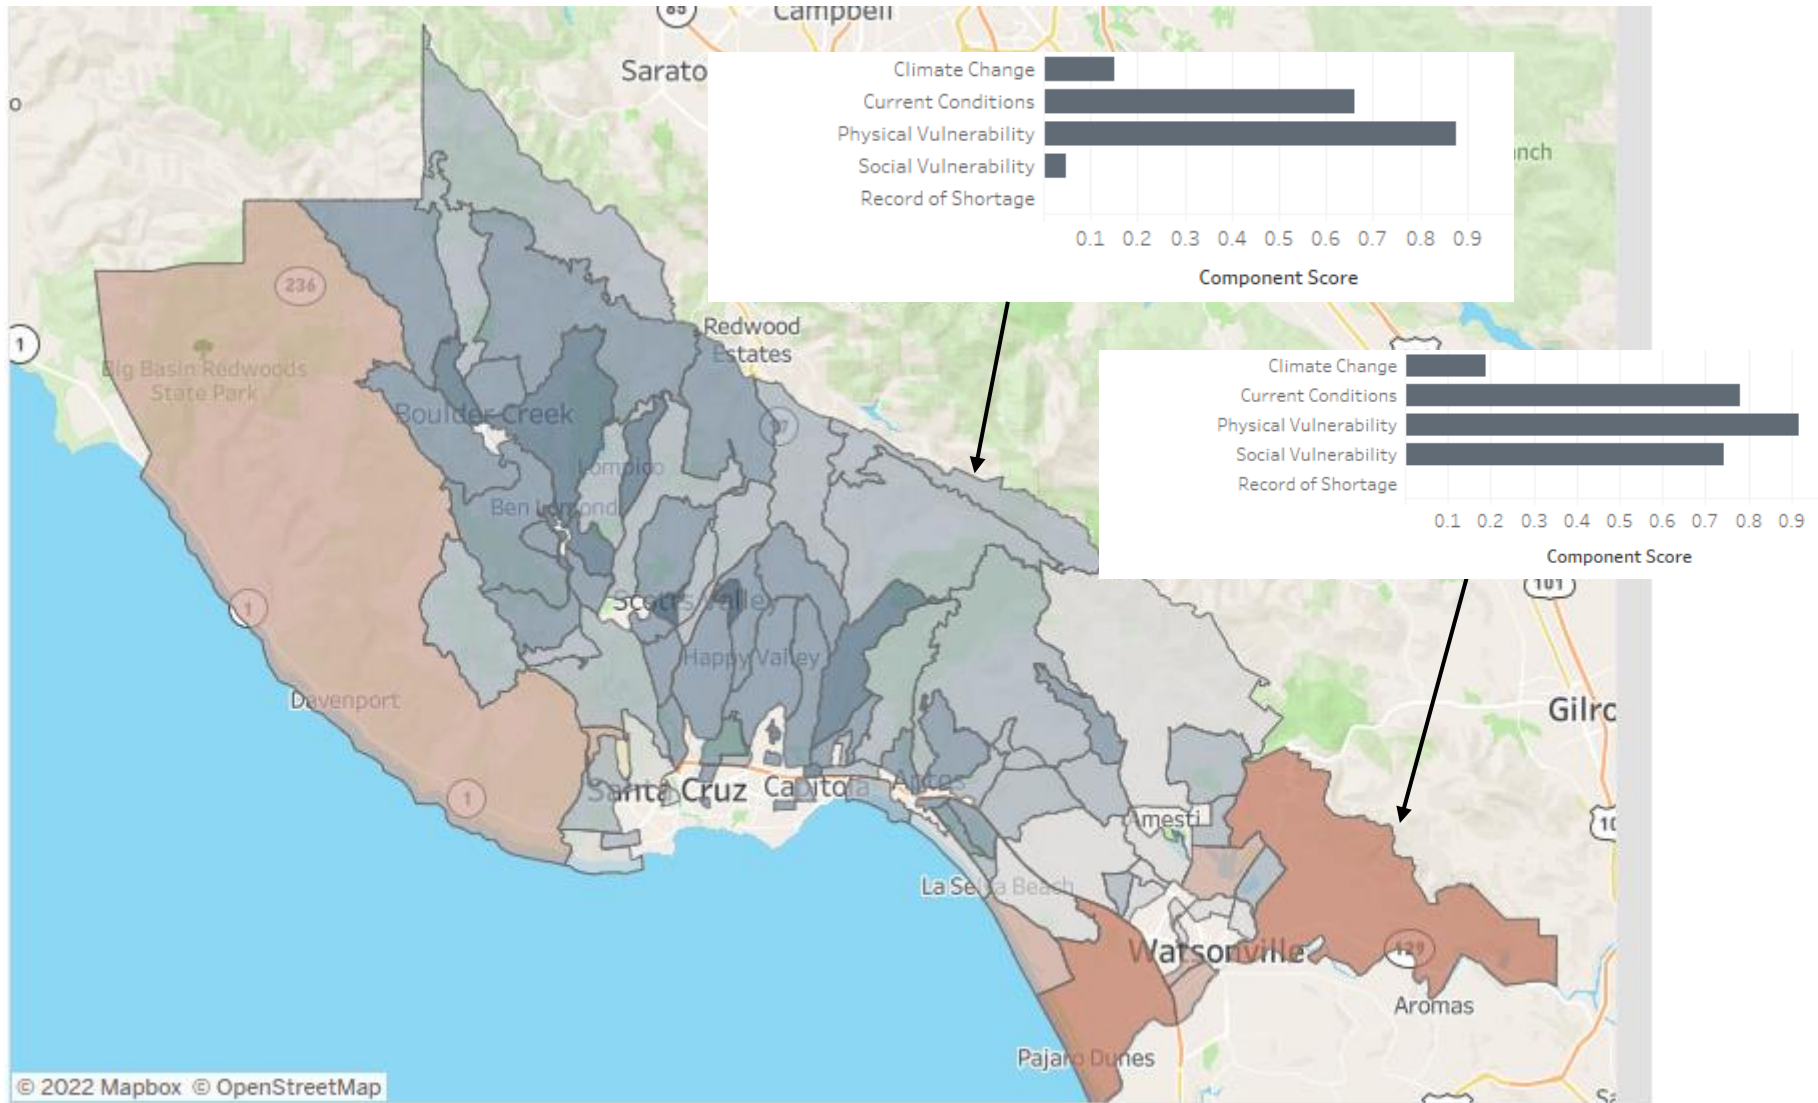

- Developed to support drought resilience planning for rural communities
- Uses 20 risk indicators, such as:
 - Climate change risks
 - Existing risks
 - Physical vulnerability
 - Social vulnerability

Risk Score Legend Colors
0 = low risk; 100 = highest risk

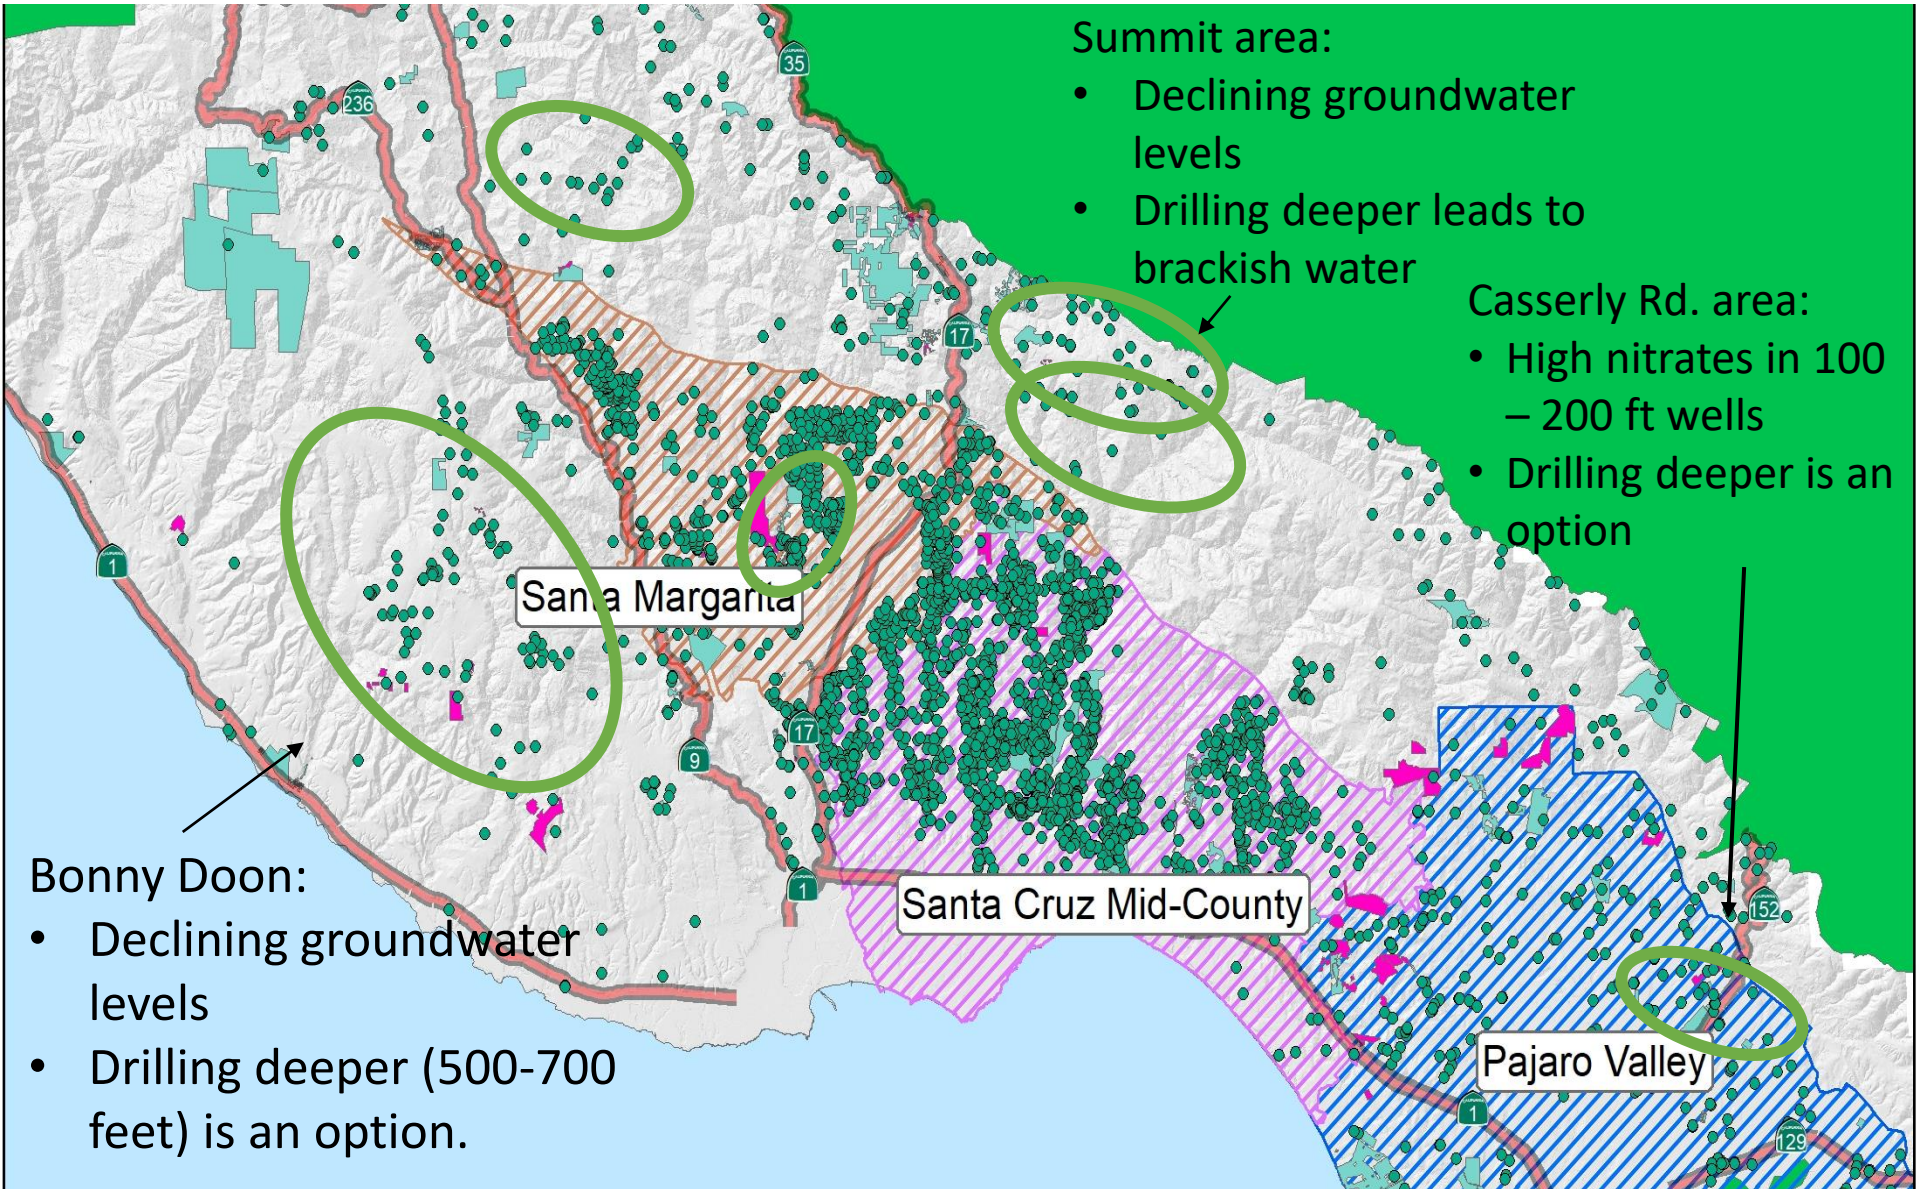

What explains the risk scores?

Risk Score Legend Colors
 0 = low risk; 100 = highest risk

Individual/small water systems and areas with known well issues

Summit area:

- Declining groundwater levels
- Drilling deeper leads to brackish water

Casserly Rd. area:

- High nitrates in 100 – 200 ft wells
- Drilling deeper is an option

Bonny Doon:

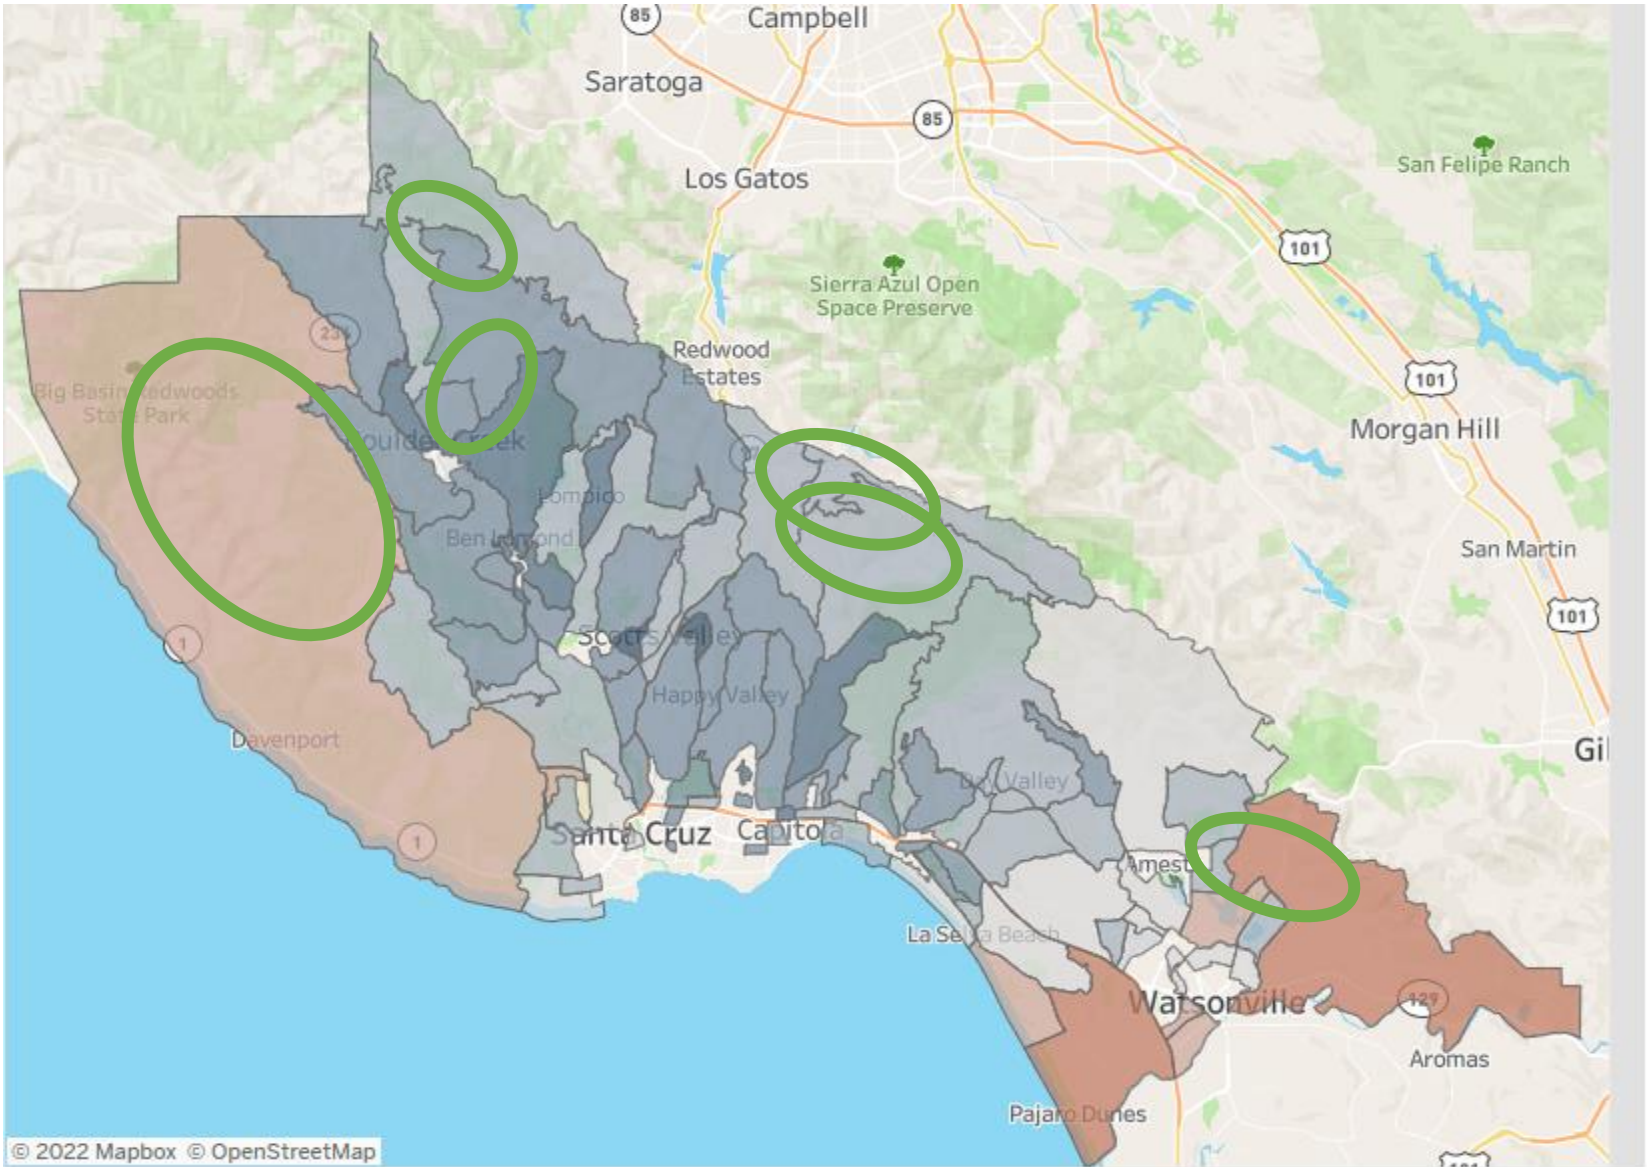

- Declining groundwater levels
- Drilling deeper (500-700 feet) is an option.

Well mitigation strategy

- Assess and improve well information
- Assess drinking water well vulnerabilities
- Identify mitigation strategies
 - interim and long-term
- Discussion
 - Develop outreach and communication
 - Define the role of the County
 - Prioritize actions and procure funds
 - Collaborate and receive support from State agencies and others

Interim and permanent well mitigation strategies

Solution	Problem	Options	Pros and Cons	Estimated Costs
Interim solution	Access to water	Water tank + bottled water	Tank water is not necessarily safe for drinking; the two must be paired	<p>One-time fees:</p> <ul style="list-style-type: none"> - 2,600 gallon water tank and materials: approximately \$2,500. - Labor and tank installation: \$1,500 - Electrical permit: \$100 <p>On-going fees:</p> <ul style="list-style-type: none"> - Tank water between \$500 to \$1,000 depending on delivery charge by water hauler. - For bottled water: \$50 to \$75 per month per house. - Not estimated: other fees associated with ongoing maintenance of the tank, including routine cleaning.
	Water quality	POU	Treats water at one tap; may need ongoing monitoring or maintenance	<p>\$1,000 to \$4,500 per unit per home, for one year.</p> <p>Costs include: initial capital costs (installation, treatment system, monitoring system) and also ongoing operation, maintenance, routine monitoring, and waste disposal costs.</p> <ul style="list-style-type: none"> - Costs vary depending on the contaminant and filtration.
	Water quality	Bottled water	Safe and effective but can be expensive in the longterm; can be difficult to distribute to isolated areas	<p>\$50 - \$75 per month per house, including delivery</p>

Interim and permanent well mitigation strategies

Solution	Problem	Options	Pros and Cons	Estimated Costs
Permanent solution	Access to water	Lowering of pump	Least expensive permanent solution, if feasible. Limited by depth of well. Energy use increases w depth. Water quality may decrease with depth.	\$5,000 - \$ 10,000
		Drill a new deeper well	Well test needed to assess yield capacity and water quality on deeper levels.	Private wells \$25K - \$75K; Water systems up to \$1.5M+
		Alternative water source/ Consolidation	Consolidation with local system is most likely alternative; Households must understand and agree with the advantages and disadvantages of connecting to a local water system.	Costs vary depending on the desired solution, technology, and number of households
	Water quality	Water treatment system	Technical, managerial, and financial capacity should be considered when assessing treatment options.	Costs vary depending on the technology, water contaminant(s), and number of households.
		Alternative source of water	Construction of a new well or consolidation with a nearby water system.	Costs vary depending on the desired solution, technology, and number of households.
